

India's first breath-based health screening device

CDSCO Approved Class-B IVD Device

Patient ID : LMBE00697

Test done data & time : 05/20/2025 15:28:14

ANOOP PRAKASH PANDEY

male, 33 yrs

A Comprehensive Health Report

Breath-based health insights personalized for you

Peasonlized Health Summary

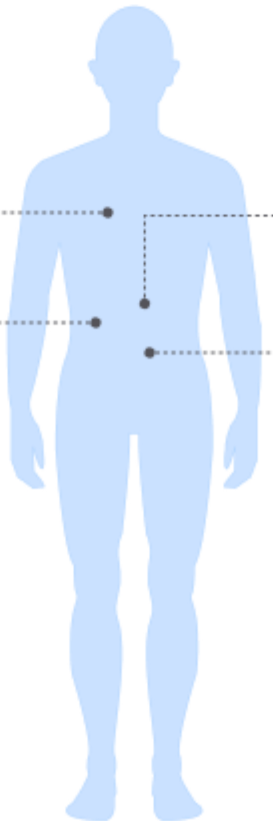

ANOOP PRAKASH PANDEY

Patient ID : LMBE00697 Test done data & time :05/20/2025 15:28:14

ANOOP PRAKASH PANDEY, Congratulations!
We've successfully completed your health screening using the Respyr device. This is a meaningful step toward staying in control of your health and uncovering opportunities for improvement.

Your breath has revealed valuable insights into your body's current state—now let's use this information to guide smarter lifestyle choices for a healthier tomorrow!

Gender	male	BMR	1451.25
Height	173 cm	Patiend id	LMBE00697
Weight	53 kg		

Sugar Score

Score percentage	Score range	Glucose Metabolism	Respyr Score Meaning	Clinical Considerations / Suggested Next Steps
85.1	Good	Indicates Efficient glucose metabolism.	Correlates with normal fasting glucose and HbA1c levels. No abnormal trends in glucose utilization or metabolic flexibility are observed.	No further evaluation typically required unless clinically indicated.

Clinical Insight:
The score reflects glucose utilization efficiency, insulin sensitivity, and metabolic flexibility. It provides an early indicator of trends in carbohydrate metabolism without quantifying exact glucose levels.

Correlation:
Respyr Sugar Score correlates with fasting blood glucose and HbA1c trends based on internal studies benchmarking breath biomarkers against standard blood glucose markers.

Disclaimer: Respyr provides non-invasive screening insights based on breath analysis. The scores and interpretations presented are intended to indicate physiological trends and support lifestyle and preventive health monitoring. Accuracy claims are based on internal blinded validation using patient classification and breath samples collected in collaboration with recognized hospitals as part of a multi-centric study conducted across India. Respyr does not diagnose, treat, or prevent any disease. This interpretation guide is intended for use by qualified healthcare providers to understand screening trends. Clinical judgment and confirmatory testing should be used before making any medical decisions. Respyr is not a substitute for standard clinical testing or professional medical evaluation.

Regulatory Status

- Respyr is registered as a Class B In Vitro Diagnostic (IVD) device under CDSCO MD5.
- The product and its manufacturing processes comply with ISO 13485:2016 and IEC 60601-1-2:2014 standards.
- Distribution and sale are authorized under MD13 and MD42 licenses.
- Clinical validation data is based on a multi-centric study with recognized hospitals across India, with internal blinded validation demonstrating 90% correlation accuracy.

Gender	male	BMR	1451.25
Height	173 cm	Patiend id	LMBE00697
Weight	53 kg		

Liver Score

Score percentage	Score range	Hepatic Stress	Respyr Score Meaning	Clinical Considerations / Suggested Next Steps
60.1	Out of range	Indicates significant hepatic stress.	Potentially reflecting liver overload or compromised metabolic processing, or patterns commonly associated with metabolic liver dysfunction.	Comprehensive liver function evaluation is suggested based on the individual's clinical scenario.

Clinical Insight:
The score reflects trends in hepatic metabolic stress and gut-liver axis activity. It serves as a noninvasive screening indicator of potential liver stress without identifying specific hepatic conditions.

Correlation:
Respyr Liver Score correlates with liver function trends and imaging findings observed in individuals with known liver history, based on internal correlation studies.

Disclaimer: Respyr provides non-invasive screening insights based on breath analysis. The scores and interpretations presented are intended to indicate physiological trends and support lifestyle and preventive health monitoring. Accuracy claims are based on internal blinded validation using patient classification and breath samples collected in collaboration with recognized hospitals as part of a multi-centric study conducted across India. Respyr does not diagnose, treat, or prevent any disease. This interpretation guide is intended for use by qualified healthcare providers to understand screening trends. Clinical judgment and confirmatory testing should be used before making any medical decisions. Respyr is not a substitute for standard clinical testing or professional medical evaluation.

Weight	53 kg		

Respiratory Score

Score percentage	Score range	Airflow / Ventilation	Respyr Score Meaning	Clinical Considerations / Suggested Next Steps
70.1	Fair	Indicates mild decrease in expiratory flow efficiency.	May correspond to early changes in airway resistance or subtle reductions in ventilatory performance. These trends are generally observed before clinically significant airflow limitation develops.	Periodic monitoring of ventilatory function may be considered depending on clinical context.

Clinical Insight:
The score reflects expiratory flow capacity, airway resistance, and ventilatory function trends. It serves as a non-invasive early indicator of changes in airflow dynamics.

Correlation:
Respyr Respiratory Score correlates with pulmonary function trends derived from expiratory pressure converted to FEV1 values. For correlation, individuals with doctor-confirmed respiratory issues and valid PFT reports were onboarded. Respyr's FEV1 trends were compared with the known respiratory status of each individual — lower FEV1 corresponded with lower Respyr scores, consistent with expected airflow limitations.

Disclaimer: Respyr provides non-invasive screening insights based on breath analysis. The scores and interpretations presented are intended to indicate physiological trends and support lifestyle and preventive health monitoring. Accuracy claims are based on internal blinded validation using patient classification and breath samples collected in collaboration with recognized hospitals as part of a multi-centric study conducted across India. Respyr does not diagnose, treat, or prevent any disease. This interpretation guide is intended for use by qualified healthcare providers to understand screening trends. Clinical judgment and confirmatory testing should be used before making any medical decisions. Respyr is not a substitute for standard clinical testing or professional medical evaluation.

Gut Score

Score percentage	Score range	Fermentation Activity	Respyr Score Meaning	Clinical Considerations / Suggested Next Steps
70.4	Fair	Indicates moderate elevation in fermentation activity.	Correlating with slight increases in hydrogen production. This may be associated with early dysbiosis or mild inefficiencies in carbohydrate absorption. Occasional bloating or digestive discomfort may be reported.	Further assessment of gut fermentation trends may be considered if symptoms persist.

Clinical Insight:
The score reflects gut fermentation activity, microbial balance, and carbohydrate absorption efficiency. It serves as a non-invasive trend indicator of fermentation imbalance without identifying specific gastrointestinal conditions.

Correlation:
Respyr Gut Score correlates with global hydrogen breath test thresholds for fermentation and absorption patterns. Sensor calibration aligns with standard H_2 concentration benchmarks.

Disclaimer: Respyr provides non-invasive screening insights based on breath analysis. The scores and interpretations presented are intended to indicate physiological trends and support lifestyle and preventive health monitoring. Accuracy claims are based on internal blinded validation using patient classification and breath samples collected in collaboration with recognized hospitals as part of a multi-centric study conducted across India.
